

ONE FOR THE FLEET • global namespace

ONE SET PER ROBOT • global, because the action hub is

ONE STACK PER ROBOT • /r1 • /r2 • /r3

Read it as one question asked twice.

ePlanSys decides which zone to be in and what has to be known there; the μ -calculus decides how to cross a floor that is still half unmeasured. Perception is what joins them: it turns a patch of one robot's occupancy grid into an event in that robot's sensing action.

A shared map would make the sensing public, and the domain says it is semi-private.
