

ONE FOR THE FLEET • global namespace

ONE SET PER ROBOT • global, because the action hub is

ONE STACK PER ROBOT • /r1 • /r2 • /r3

Division of responsibility between the two planners.

ePlanSys determines which zone each robot must occupy and what must be known there. The μ -calculus planner determines whether that zone is reachable over observed floor. Perception connects the two by classifying a region of one robot's occupancy grid as an event in that robot's sensing action.

A shared map would make the sensing public; the domain declares it semi-private.
